# Introduction

This book provides solutions to signal processing problems in GATE.

## Chapter 1

# Harmonics

- 1.1 A damper with damping coefficient,  $c$ , is attached to a mass of 5 kg and spring of stiffness 5 kN/m as shown in figure. The system undergoes under-damped oscillations. If the ratio of the 3<sup>rd</sup> amplitude to the 4<sup>th</sup> amplitude of oscillations is 1.5, the value of  $c$  is ?

(GATE AE-62 (2022)) **Solution:**

- 1.2 A uniform rigid prismatic bar of total mass  $m$  is suspended from a ceiling by two identical springs as shown in figure. Let  $\omega_1$  and  $\omega_2$  be the natural frequencies of mode I and mode II respectively ( $\omega_1 < \omega_2$ ). The value of  $\frac{\omega_2}{\omega_1}$  is \_\_\_\_\_ (rounded off to one decimal place). (GATE AE 2022 QUESTION 63)

**Solution:**

**i:** For vertical oscillations: from Fig. 1.2,

$$m \frac{d^2 x(t)}{dt^2} + 2kx(t) = 0 \quad (1.1)$$

Assuming the bar is at mean position and has non-zero initial velocity, we can

Figure 1.1: Figure given in question

write it's laplace transform as:

$$s^2 m X(s) - m v(0) + 2k X(s) = 0 \quad (1.2)$$

$$\implies X(s) = \frac{v(0)}{s^2 + \frac{2k}{m}} \quad (1.3)$$

Parameter	Description	Value
$X(s)$	position in laplace domain	$X(s)$
$\Theta(s)$	angle rotated in laplace domain	$\Theta(s)$
$x(t)$	position of mass w.r.t time	$x(t)$
$\theta(t)$	angle rotated by mass w.r.t time	$\theta(t)$
$\alpha(t)$	angular acceleration of mass w.r.t time	$\alpha(t)$
$k$	spring constant	$k$
$m$	mass of the block	$m$
$L$	length of the mass	$L$
$\omega_o$	initial angular velocity of mass	$\omega_o$
$v(0)$	initial velocity of mass	$v(0)$

Table 1.1: input values

On taking inverse laplace transform we get,

$$x(t) = v(0) \sqrt{\frac{m}{2k}} \sin \sqrt{\frac{2k}{m}} t \quad (1.4)$$

$$\therefore \omega_1 = \sqrt{\frac{2k}{m}} \quad (1.5)$$

ii: For torsional strain from Fig. 1.3,

$$I\alpha(t) = -\frac{kL^2\theta(t)}{2} \quad (1.6)$$

Assuming it is at mean position and having non-zero angular velocity we can write it's laplace transform as:

$$s^2 I\Theta(s) - I\omega_o + \frac{kL^2\Theta(s)}{2} = 0 \quad (1.7)$$

substituting values from Table 1.1:

$$\Theta(s) = \frac{\omega_o}{s^2 + \frac{6k}{m}} \quad (1.8)$$

Figure 1.2: Figure for Vertical strain

On taking inverse laplace transform we get,

$$\theta(t) = \omega_o \sqrt{\frac{m}{6k}} \sin \sqrt{\frac{6k}{m}} t \quad (1.9)$$

$$\therefore \omega_2 = \sqrt{\frac{6k}{m}} \quad (1.10)$$

From (1.5) and (1.10) we see that

$$\frac{\omega_2}{\omega_1} = \sqrt{3} \quad (1.11)$$

Figure 1.3: Figure for Torsional strain

1.3 A spring-mass system having a mass  $m$  and spring constant  $k$ , placed horizontally on a foundation, is connected to a vertically hanging mass  $m$  with the help of an inextensible string. Ignore the friction in the pulleys and also the inertia of pulleys, string and spring. Gravity is acting vertically downward as shown. The natural frequency of the system in rad/s is

- (A)  $\sqrt{\frac{4k}{3m}}$
- (B)  $\sqrt{\frac{k}{2m}}$
- (C)  $\sqrt{\frac{k}{3m}}$
- (D)  $\sqrt{\frac{4k}{5m}}$

(GATE XE 2022)

**Solution:**

Parameters	Description	Value
$x(t)$	Displacement of mass $m$ on foundation at time $t$	
$x(0)$	Displacement of mass $m$ on foundation at time $t = 0$	0
$x'(0)$	Velocity of mass $m$ on foundation at time $t = 0$	0

Table 1.2: Parameters

$$T - kx = m \frac{d^2 x}{dt^2} \quad (1.12)$$

$$mg - 2T = m \frac{d^2 \left(\frac{x}{2}\right)}{dt^2} \quad (1.13)$$

$$\implies mg - 2kx = \frac{5}{2} m \frac{d^2 x}{dt^2} \quad (1.14)$$

$$\frac{d^2 x}{dt^2} \xleftrightarrow{\mathcal{L}} s^2 X(s) - sx(0) - x'(0) \quad (1.15)$$

$$t^n \xleftrightarrow{\mathcal{L}} \frac{n!}{s^{n+1}} \quad (1.16)$$

From the Laplace transforms (1.15) and (1.16), we get

$$\frac{mg}{s} - 2kX(s) = \frac{5}{2} m (s^2 X(s) - sx(0) - x'(0)) \quad (1.17)$$

$$\implies X(s) = \frac{\frac{2g}{5}}{s \left(s^2 + \frac{4k}{5m}\right)} \quad (1.18)$$

$$= \frac{mg}{2ks} - \frac{mgs}{2k \left(s^2 + \frac{4k}{5m}\right)} \quad (1.19)$$

$$\cos at \xleftrightarrow{\mathcal{L}} \frac{s}{s^2 + a^2} \quad (1.20)$$

From the Laplace transforms (1.16) and (1.20), we get

$$x(t) = \frac{mg}{2k} \left( 1 - \cos \left( \sqrt{\frac{4k}{5m}} t \right) \right) u(t) \quad (1.21)$$

$$\implies \omega = \sqrt{\frac{4k}{5m}} \quad (1.22)$$

Figure 1.4: Plot of  $x(t)$  for  $m = 1kg$ ,  $k = 1N/m^2$

## Chapter 2

2.1

## Chapter 3

# Z-transform

3.1 Consider the following recursive iteration scheme for different values of variable  $P$  with the initial guess  $x_1 = 1$ :

$$x_{n+1} = \frac{1}{2} \left( x_n + \frac{P}{x_n} \right), \quad n = 1, 2, 3, 4, 5$$

For  $P = 2$ ,  $x_5$  is obtained to be 1.414, rounded off to 3 decimal places. For  $P = 3$ ,  $x_5$  is obtained to be 1.732, rounded off to 3 decimal places.

If  $P = 10$ , the numerical value of  $x_5$  is \_\_\_\_\_. (*round off to three decimal places*)  
(GATE CE 2022)

**Solution:**

Applying  $A.M \geq G.M$  inequality,

$$\frac{x_n + \frac{P}{x_n}}{2} \geq \sqrt{P} \tag{3.1}$$

$$\implies x_{n+1} \geq \sqrt{P} \tag{3.2}$$

Solving the equation,

$$2x_{n+1}x_n - x_n^2 - P = 0 \quad (3.3)$$

Applying  $Z$ -transform we get,

$$X(z) * X(z) = \frac{PZ^{-1}}{(1 - z^{-1})(2 - z^{-1})} \quad (3.4)$$

$$= P \left( \frac{z^{-1}}{1 - z^{-1}} - \frac{z^{-1}}{2 - z^{-1}} \right) \quad (3.5)$$

From the transformation pairs,

$$x_{n-a} \xleftrightarrow{\mathcal{Z}} z^{-a} X(z) \quad (3.6)$$

$$x_{n_1} \times x_{n_2} \xleftrightarrow{\mathcal{Z}} X_1(z) * X_2(z) \quad (3.7)$$

$$\frac{u(n-1)}{a^n} \xleftrightarrow{\mathcal{Z}} \frac{z^{-1}}{a - z^{-1}} \quad (3.8)$$

Now, applying inverse  $Z$ -transform,

$$x_n^2 = P \left( u(n-1) - \frac{u(n-1)}{2^n} \right) \quad (3.9)$$

$$\Rightarrow x_n^2 = P \left( 1 - \frac{1}{2^n} \right) \quad [\because n \geq 1] \quad (3.10)$$

Similarly,

$$x_{n+1}^2 = P \left( 1 - \frac{1}{2^{n+1}} \right) \quad (3.11)$$

$$\Rightarrow \lim_{n \rightarrow \infty} \frac{x_{n+1}}{x_n} = \lim_{n \rightarrow \infty} \sqrt{\frac{P \left( 1 - \frac{1}{2^n} \right)}{P \left( 1 - \frac{1}{2^{n+1}} \right)}} \quad (3.12)$$

$$= 1 \quad (3.13)$$

Hence, the system is convergent.

Now finding the limit of the sequence,

$$x^2 = \lim_{x \rightarrow \infty} P \left( 1 - \frac{1}{2^n} \right) \quad (3.14)$$

$$\implies x = \pm \sqrt{P} \quad (3.15)$$

From (3.2) and (3.15),

$$x_{n+1} = \sqrt{P} \quad (3.16)$$

Therefore, for  $P = 10$  the value of  $x_5$  is,

$$x_5 = \sqrt{10} \quad (3.17)$$

$$\therefore x_5 = 3.162 \quad (3.18)$$

## Chapter 4

## Systems

4.1 The damping ratio and undamped natural frequency of a closed loop system as shown in the figure, are denoted as  $\zeta$  and  $\omega_n$ , respectively. The values of  $\zeta$  and  $\omega_n$  are

- (a)  $\zeta = 0.5$  and  $\omega_n = 10$  rad/s
- (b)  $\zeta = 0.1$  and  $\omega_n = 10$  rad/s
- (c)  $\zeta = 0.707$  and  $\omega_n = 10$  rad/s
- (d)  $\zeta = 0.707$  and  $\omega_n = 100$  rad/s

(GATE EE 2022) **Solution:**

We will use Mason's Gain Formula to calculate the transfer function of this system.

Parameter	Description	Values
m	load of system	
k	stiffness of system	
$\omega_n$	Natural frequency	$\sqrt{\frac{k}{m}}$
$\zeta$	Damping ratio	$\frac{c}{2m\omega_n}$
$y(t)$	Output of system	
$x(t)$	Input to the system	
c	Damping coefficient	
$T(s)$	Transfer function of system	$\frac{Y(s)}{R(s)}$

Table 4.1: Parameter Table

First converting the given diagram to a signal flow graph :

Figure 4.1: Signal Flow Diagram

Mason's Gain Formula is given by :

$$H(s) = \sum_{i=1}^N \left( \frac{P_i \Delta_i}{\Delta} \right) \quad (4.1)$$

This signal flow graph has only one forward path whose gain is given by :

$$P_1 = \frac{10}{s} \frac{10}{s} \quad (4.2)$$

$$= \frac{100}{s^2} \quad (4.3)$$

Parameter	Description
N	Number of forward paths
L	Number of loops
$P_k$	Forward path gain of $k^{th}$ path
$\Delta_k$	Associated path factor
$\Delta$	Determinant of the graph

Table 4.2: Parameter Table - Mason's Gain Law

Parameter	Formula
$\Delta$	$1 + \sum_{k=1}^L \left( (-1)^k \text{Product of gain of groups of k isolated loops} \right)$
$\Delta_k$	$\Delta$ part of graph that is not touching $k^{th}$ forward path

Table 4.3: Formula Table - Mason's Gain Law

The loop gain for loop between Node-2 and Node-3 is :

$$L_1 = \frac{10}{s} (-1) \quad (4.4)$$

$$= -\frac{10}{s} \quad (4.5)$$

The loop gain for loop between Node-1 and Node-4 is :

$$L_1 = \frac{10}{s} \frac{10}{s} (-1) \quad (4.6)$$

$$= -\frac{100}{s^2} \quad (4.7)$$

Using Table 4.3,  $\Delta$  is :

$$\Delta = 1 - \left( -\frac{10}{s} - \frac{100}{s^2} \right) \quad (4.8)$$

$$= 1 + \frac{10}{s} + \frac{100}{s^2} \quad (4.9)$$

There are no two isolated loops available. Hence all further terms will be zero.

As both the loops are in contact with the only forward path,

$$\Delta_1 = 1 \quad (4.10)$$

Using equation (4.1) :

$$H(s) = \frac{\frac{100}{s^2}}{1 + \frac{10}{s} + \frac{100}{s^2}} \quad (4.11)$$

$$= \frac{100}{s^2 + 10s + 100} \quad (4.12)$$

Referring to Table 4.1, the general equation of the damping system is second order and can be written as :

$$m\ddot{y}(t) + c\dot{y}(t) + ky(t) = x(t) \quad (4.13)$$

Take the Laplace transform and solve for  $\frac{Y(s)}{X(s)}$  :

$$\frac{Y(s)}{X(s)} = \frac{\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2} \quad (4.14)$$

$$\Rightarrow H(s) = \frac{\omega_n^2}{s^2 + 2\zeta\omega_n s + \omega_n^2} \quad (4.15)$$

Comparing equations (4.12) and (4.15) ,

$$\omega_n^2 = 100 \quad (4.16)$$

$$\Rightarrow \omega_n = 10 \text{ rad/s} \quad (4.17)$$

$$2\zeta\omega_n = 10 \quad (4.18)$$

$$\Rightarrow \zeta = 0.5 \quad (4.19)$$

Figure 4.2: Magnitude plot

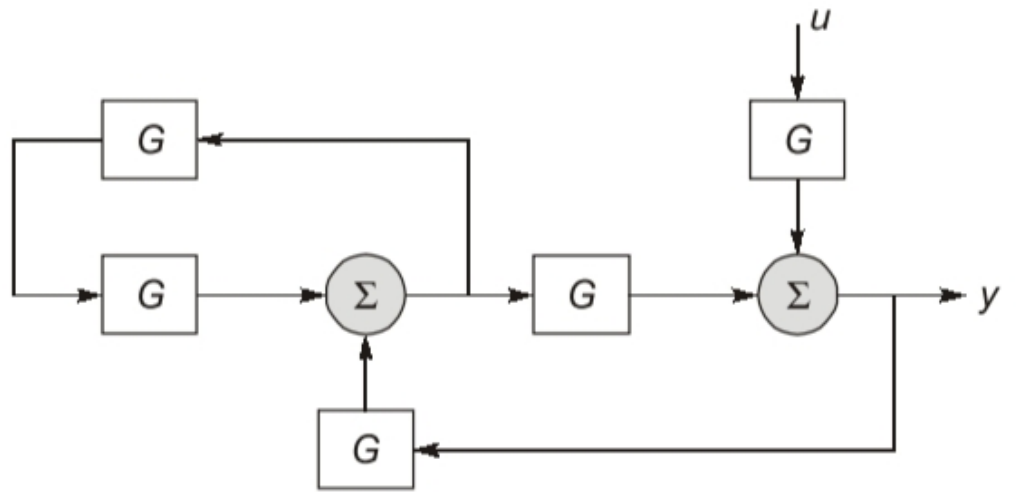

Figure 4.3: Phase plot

4.2 In the block diagram shown in the figure, the transfer function  $G = \frac{K}{\tau s + 1}$  with  $K > 0$  and  $\tau > 0$ . The maximum value of  $K$  below which the system remains stable is \_\_\_\_\_(rounded off to two decimal places) (GATE CH 2022)

**Solution:**

Parameter	Value	Description
$G$	$\frac{K}{\tau s + 1}$	Transfer function shown in blocks
$Y$		Laplace transform of $y$ (output)
$U$		Laplace transform of $u$ (input)
$X, Z$		Laplace transform of $x$ and $z$
$T$	$\frac{Y}{U}$	Transfer function of complete system

Table 4.4: Parameters

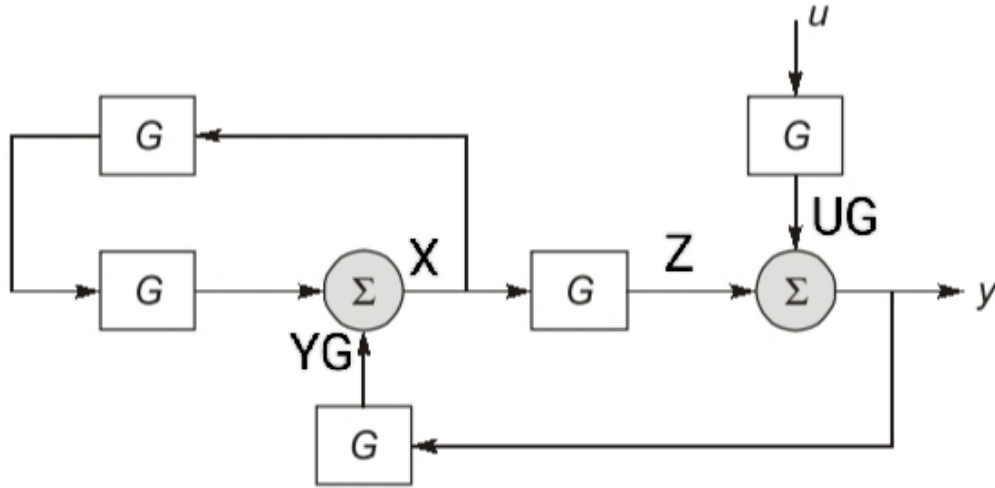

Figure 4.4: Block Diagram

$$X = XG^2 + YG \quad (4.20)$$

$$\Rightarrow X = \frac{YG}{1 - G^2} \quad (4.21)$$

$$Z = XG \quad (4.22)$$

$$Y = Z + UG \quad (4.23)$$

$$Y = XG + UG \quad (4.24)$$

$$Y = \frac{YG^2}{1 - G^2} + UG \quad (4.25)$$

$$\Rightarrow Y = \frac{UG(1 - G^2)}{1 - 2G^2} \quad (4.26)$$

From Table 4.4,

$$T = \frac{G(1 - G^2)}{1 - 2G^2} \quad (4.27)$$

$$= \frac{K \left( 1 - \frac{K^2}{(\tau s + 1)^2} \right)}{\left( 1 - \frac{2K^2}{(\tau s + 1)^2} \right) (\tau s + 1)} \quad (4.28)$$

$$= \frac{K(\tau^2 s^2 + 2\tau s + 1 - K^2)}{\tau^3 s^3 + 3\tau^2 s^2 + (3\tau - 2K^2\tau)s + 1 - 2K^2} \quad (4.29)$$

So, Characteristic equation :

$$\tau^3 s^3 + 3\tau^2 s^2 + (3\tau - 2K^2\tau)s + 1 - 2K^2 = 0 \quad (4.30)$$

For a characteristic equation  $a_0 s^n + a_1 s^{n-1} + a_2 s^{n-2} + \dots a_n = 0$ ,

$s^n$	$a_0$	$a_2$	$a_4$	...
$s^{n-1}$	$a_1$	$a_3$	$a_5$	...
$s^{n-2}$	$b_1 = \frac{a_1 a_2 - a_3 a_0}{a_1}$	$b_2 = \frac{a_1 a_4 - a_5 a_0}{a_1}$	...	..
$s^{n-3}$	$c_1 = \frac{b_1 a_3 - b_2 a_1}{b_1}$	$\vdots$		
$\vdots$	$\vdots$	$\vdots$		
$s^1$	$\vdots$	$\vdots$		
$s^0$	$a_n$			

Table 4.5: Routh Array

From Table 4.5:

$s^3$	$\tau^3$	$3\tau - 2K^2\tau$
$s^2$	$3\tau^2$	$1 - 2K^2$
$s^1$	$\frac{8}{3}\tau(1 - K^2)$	0
$s^0$	$1 - 2K^2$	

Table 4.6:

Given  $\tau > 0$  and  $K > 0$ , for system to be stable,

$$1 - K^2 > 0 \tag{4.31}$$

$$1 - 2K^2 > 0 \tag{4.32}$$

$$\implies 0 < K < \frac{1}{\sqrt{2}} \tag{4.33}$$

$$K_{max} \approx 0.71 \tag{4.34}$$

## Chapter 5

# Sequences

5.1 Discrete signals  $x(n)$  and  $y(n)$  are shown below. The cross-correlation  $r_{xy}(0)$  is:

Figure 5.1: Question Figure

(GATE BM 2022)

**Solution:**

Parameter	Description	Value
$x(n)$	First Sequence	$x(n) = \begin{cases} 0 & ; n < 0 \\ \left(1, \frac{1}{\sqrt{2}}, 0, -\frac{1}{\sqrt{2}}, -1, -\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}}\right) & ; 0 \leq n \leq 7 \\ 0 & ; n > 7 \end{cases}$
$y(n)$	Second Sequence	$y(n) = \begin{cases} 0 & ; n < 0 \\ \left(\frac{1}{\sqrt{2}}, 0, -\frac{1}{\sqrt{2}}, -1, -\frac{1}{\sqrt{2}}, 0, \frac{1}{\sqrt{2}}, 1\right) & ; 0 \leq n \leq 7 \\ 0 & ; n > 7 \end{cases}$
$r_{xy}(k)$	Cross-correlation	$\sum_{m=-\infty}^{\infty} x(m) y(m-k)$

Table 1: Parameter Table

It can be seen that :

$$y(n) = x(n+1) \quad (5.1)$$

From Table 1 :

$$r_{xy}(k) = \sum_{m=-\infty}^{\infty} x(m) y(m-k) \quad (5.2)$$

$$= x(k) * y(-k) \quad (5.3)$$

From (5.1):

$$r_{xy}(k) = x(k+1) * x(-k) \quad (5.4)$$

$$= \sum_{n=-\infty}^{\infty} x(n+1) x(n+k) \quad (5.5)$$

By definition of  $x(n)$  from Table 1:

$$r_{xy}(k) = \sum_{n=0}^6 x(n+1) x(n+k) \quad (5.6)$$

$$r_{xy}(0) = \sum_{n=0}^6 x(n+1) x(n) \quad (5.7)$$

Using values from Fig. 5.1:

$$r_{xy}(0) = 2\sqrt{2} \quad (5.8)$$

Figure 5.2: Verification of result by DFT

## Chapter 6

# Sampling

6.1

## Chapter 7

# Contour Integration

7.1 In the complex  $z$ -domain, the value of integral  $\oint_C \frac{z^3-9}{3z-i} dz$  is

- (a)  $\frac{2\pi}{81} - 6i\pi$
- (b)  $\frac{2\pi}{81} + 6i\pi$
- (c)  $-\frac{2\pi}{81} + 6i\pi$
- (d)  $-\frac{2\pi}{81} - 6i\pi$

(GATE 2022 BM)

**Solution:**

Simplyfying the Contour Integral to the standard form we get,

$$\oint_C \frac{z^3-9}{3z-i} dz = \frac{1}{3} \oint_C \frac{z^3-9}{z-\frac{i}{3}} dz \quad (7.1)$$

From Cauchy's residue theorem,

$$\oint_C f(z) dz = 2\pi i \sum R_j \quad (7.2)$$

We can observe a non-repeated pole at  $z = \frac{i}{3}$  and thus  $a = \frac{i}{3}$ ,

$$R = \lim_{z \rightarrow a} (z - a) f(z) \quad (7.3)$$

$$\Rightarrow R = \frac{1}{3} \lim_{z \rightarrow \frac{i}{3}} \left( z - \frac{i}{3} \right) \frac{z^3 - 9}{z - \frac{i}{3}} \quad (7.4)$$

$$= \frac{-i}{81} - 3 \quad (7.5)$$

Therefore, from (7.2) and (7.5)

$$\oint_C \frac{z^3 - 9}{3z - i} dz = \frac{2\pi}{81} - 6i\pi \quad (7.6)$$

## Chapter 8

# Laplace Transform

8.1 Consider the differential equation  $\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + y = 0$ . The boundary conditions are  $y = 0$  and  $\frac{dy}{dx} = 1$  at  $x = 0$ . Then the value of  $y$  at  $x = \frac{1}{2}$  (GATE AE 2022)

**Solution:**

Parameters	Values	Description
$y(0)$	0	$y$ at $x = 0$
$y'(0)$	1	$\frac{dy}{dx}$ at $x = 0$

Table 8.1: Parameters

$$\frac{d^2y}{dx^2} \xleftrightarrow{\mathcal{L}} s^2Y(s) - sy(0) - y'(0) \quad (8.1)$$

$$\frac{dy}{dx} \xleftrightarrow{\mathcal{L}} sY(s) - y(0) \quad (8.2)$$

Applying Laplace Transform, using (8.1) and (8.2),

$$s^2Y(s) - sy(0) - y'(0) - 2(sY(s) - y(0)) + Y(s) = 0 \quad (8.3)$$

From Table 8.1,

$$(s^2 - 2s + 1)Y(s) - 1 = 0 \quad (8.4)$$

$$Y(s) = \frac{1}{(s-1)^2} \quad (8.5)$$

$$t^n \xleftrightarrow{\mathcal{L}} \frac{n!}{s^{n+1}} \quad (8.6)$$

$$e^{at}x(t) \xleftrightarrow{\mathcal{L}} X(s-a) \quad (8.7)$$

Taking Inverse Laplace Transform for  $Y(s)$ , using (8.6) and (8.7),

$$y(x) = xe^x \quad (8.8)$$

$$\implies y\left(\frac{1}{2}\right) = \frac{\sqrt{e}}{2} \quad (8.9)$$

Figure 8.1: Plot of  $y(x)$

## 8.2 A process described by the transfer function

$$G_p(s) = \frac{(10s + 1)}{(5s + 1)}$$

is forced by a unit step input at time  $t = 0$ . The output value immediately after the unit step input (at  $t = 0^+$ ) is ? (Gate 2022 CH 34)

**Solution:**

Parameters	Description
$X(s)$	Laplace transform of $x(t)$
$Y(s)$	Laplace transform of $y(t)$
$G_p(s) = \frac{Y(s)}{X(s)}$	Transfer function
$x(t) = u(t)$	unit step function

Table 8.2: Given parameters

$$G_p(s) = \frac{Y(s)}{X(s)} = \frac{(10s + 1)}{(5s + 1)} \quad (8.10)$$

$$u(t) \xleftrightarrow{\mathcal{L}} \frac{1}{s} \quad (8.11)$$

From equation (8.11):

$$Y(s) = \frac{(10s + 1)}{s(5s + 1)} \quad (8.12)$$

$$= \frac{1}{s} + \frac{5}{5s + 1} \quad (8.13)$$

Taking inverse laplace transformation,

$$\frac{1}{s} \xleftrightarrow{\mathcal{L}^{-1}} u(t) \quad (8.14)$$

$$\frac{1}{s - c} \xleftrightarrow{\mathcal{L}^{-1}} e^{ct} u(t) \quad (8.15)$$

$$y(t) = \left(1 + e^{-\frac{t}{5}}\right) u(t) \quad (8.16)$$

$$y(0^+) = 2 \quad (8.17)$$

Figure 8.2: Graph of  $y(t)$

8.3 The transfer function of a real system  $H(S)$  is given as:

$$H(s) = \frac{As + B}{s^2 + Cs + D}$$

where  $A, B, C$  and  $D$  are positive constants. This system cannot operate as

- (A) Low pass filter
- (B) High pass filter
- (C) Band pass filter
- (D) An Integrator

(GATE EE 11 2022)

**Solution:** The transfer function  $H(s)$  is given by:

$$H(s) = \frac{As + B}{s^2 + Cs + D} \quad (8.18)$$

Put  $s = j\omega$  in (8.18):

$$H(j\omega) = \frac{A(j\omega) + B}{(j\omega)^2 + C(j\omega) + D} \quad (8.19)$$

$$|H(j\omega)| = \frac{\sqrt{(A\omega)^2 + B^2}}{\sqrt{(D - \omega^2)^2 + (\omega C)^2}} \quad (8.20)$$

a) Low Pass Filter:

At low frequency ( $\omega = 0$ ):

$$|H(\omega = 0)| = \frac{B}{D} \quad (8.21)$$

$\therefore H(s)$  can operate as Low pass filter.

Parameter	Description
Low Pass Filter	The gain should be finite at low frequency
High Pass Filter	The gain should be finite at high frequency
Band Pass Filter	Finite gain over frequency band
Integrator	Transfer function should have at least one pole at origin

Table 8.3: Conditions

b) High Pass Filter:

At high frequency ( $\omega = \infty$ ):

$$|H(\omega = \infty)| = 0 \quad (8.22)$$

$\therefore H(s)$  cannot operate as High pass filter.

c) Band Pass Filter:

Assuming B is a very less positive valued constant as compared to others:

$$|H(j\omega)| = \frac{(A\omega)}{\sqrt{(D - \omega^2)^2 + (\omega C)^2}} \quad (8.23)$$

$$\implies |H(\omega = 0)| = 0 \text{ and } |H(\omega = \infty)| = 0 \quad (8.24)$$

$\therefore H(s)$  passes frequency be-

tween low and high frequencies.

$\therefore H(s)$  can operate as a band pass filter.

d) Integrator:

At very high value of frequency( $\omega \rightarrow \infty$ ):

$$H(s) \approx \frac{As}{s^2} \approx \frac{A}{s} \quad (8.25)$$

From Table 8.3:

$\therefore H(s)$  can operate as an Integrator.

8.4 In a circuit, there is a series connection of an ideal resistor and an ideal capacitor. The conduction current (in Amperes) through the resistor is  $2 \sin(t + \frac{\pi}{2})$ . The displacement current (in Amperes) through the capacitor is \_\_\_\_\_.

- (A)  $2 \sin(t)$
- (B)  $2 \sin(t + \pi)$
- (C)  $2 \sin(t + \frac{\pi}{2})$
- (D) 0

(GATE 2022 EC 24)

**Solution:**

Parameter	Description	Value
$I_c$	Conduction Current	$2 \sin(t + \frac{\pi}{2})$
$A$	Cross-sectional area	

Table 8.4: Parameters

Parameter	Description	Formula
$Q$	Charge	$\int I_c dt$
$D$	Electric Displacement	$\frac{Q}{A}$
$J_D$	Displacement current density	$\frac{\partial D}{\partial t}$
$I_D$	Displacement current	$J_D \times A$

Table 8.5: Formulae

S Domain	Time Domain
$\frac{1}{s}$	$u(t)$
$\frac{-s}{a^2+s^2}$	$-\cos(at)$
$\frac{a}{a^2+s^2}$	$\sin(at)$
$\frac{1}{s+a}$	$e^{-at}$

Table 8.6: Laplace transforms

$$\mathcal{L} \left[ \int f(t) dt \right] = \int_0^\infty \left[ \int f(t) dt \right] e^{-st} dt \quad (8.26)$$

$$= \int_0^\infty u dv \quad \text{where} \begin{cases} u = \int f(t) dt \\ dv = e^{-st} dt \end{cases} \quad (8.27)$$

$$= uv - v \int du \quad (8.28)$$

$$= \frac{1}{s} \int f(t) dt|_0 + \frac{1}{s} \int_0^\infty f(t) e^{-st} dt \quad (8.29)$$

$$\Rightarrow \frac{1}{s} \int f(t) dt|_0 + \frac{1}{s} F(s) \quad (8.30)$$

Figure 8.3: Circuit 1

From Table 8.5, Table 8.6 and eq (8.30)

$$I_c(s) = \frac{2s}{s^2 + 1} \quad (8.31)$$

$$Q_c(s) = \frac{2}{s(s^2 + 1)} \quad (8.32)$$

$$D(s) = \frac{1}{A} \left( \frac{2}{s(s^2 + 1)} \right) \quad (8.33)$$

$$J_D(s) = \frac{2}{A} \left( \frac{1}{s^2 + 1} \right) \quad (8.34)$$

$$I_D(s) = \frac{2}{s^2 + 1} \quad (8.35)$$

$$\Rightarrow I_D = 2 \sin t \quad (8.36)$$

Figure 8.4: Phasor plot

From figure 8.4, phase of  $I_d$  is  $\frac{\pi}{2}$

$$\therefore I_d = 2 \sin \left( t + \frac{\pi}{2} \right) \quad (8.37)$$

$\therefore$  (C) is correct.

Figure 8.5: Thoritical vs Practical simulation

8.5 Given,  $y = f(x)$ ;  $\frac{d^2y}{dx^2} + 4y = 0$ ;  $y(0) = 0$ ;  $\frac{dy}{dx}(0) = 1$ . The problem is a/an

- (a) initial value problem having solution  $y = x$
- (b) boundary value problem having solution  $y = x$
- (c) initial value problem having solution  $y = \frac{1}{2} \sin 2x$
- (d) boundary value problem having solution  $y = \frac{1}{2} \sin 2x$

(GATE 2022 ES)

**Solution:**

Figure 8.6: Displacement current

The above equation can be written as,

$$y''(t) + 4y(t) = 0 \quad (8.38)$$

Using the Laplace transformation pairs,

$$y''(t) \xleftrightarrow{\mathcal{L}} s^2 Y(s) - sy(0) - y'(0) \quad (8.39)$$

$$y(t) \xleftrightarrow{\mathcal{L}} Y(s) \quad (8.40)$$

$$\sin at \xleftrightarrow{\mathcal{L}} \frac{a}{a^2 + s^2} \quad (8.41)$$

Applying Laplace transform for the equation we get,

$$s^2 Y(s) - 1 + 4Y(s) = 0 \quad (8.42)$$

$$\implies Y(s) = \frac{1}{4 + s^2} \quad (8.43)$$

Now, applying inverse laplace transform we get,

$$y(t) = \frac{1}{2} \sin 2t \quad (\text{from (8.41)}) \quad (8.44)$$

Since, the conditions at the same point(0) are mentioned, it is an initial valued problem having solution  $y = \frac{1}{2} \sin 2x$ .

Figure 8.7:  $y(x)$  vs  $x$  graph

8.6 Let a causal LTI system be governed by the following differential equation,

$$y(t) + \frac{1}{4} \frac{dy}{dt} = 2x(t) \quad (8.45)$$

where  $x(t)$  and  $y(t)$  are the input and output respectively. It's impulse response is  
(GATE EE-2022)

**Solution: Solution:**

From (8.45), corresponding Laplace transform,

$$Y(s) + \frac{1}{4}(sY(s) - y(0)) = 2X(s) \quad (8.46)$$

Since it is causal LTI system,

$$y(0) = 0 \quad (8.47)$$

$$\Rightarrow Y(s) + \frac{1}{4}sY(s) = 2X(s) \quad (8.48)$$

$$\Rightarrow Y(s) = X(s) \frac{8}{4+s} \quad (8.49)$$

$$\Rightarrow H(s) = \frac{8}{4+s} \quad ROC : Re(s) > -4 \quad (8.50)$$

Taking inverse laplace transform and applying causality conditions

$$h(t) = 8e^{-4t}u(t) \quad (8.51)$$

8.7 Assuming  $s > 0$ ; Laplace transform for  $f(x) = \sin(ax)$  is

(A)  $\frac{a}{s^2+a^2}$

(B)  $\frac{s}{s^2+a^2}$

(C)  $\frac{a}{s^2-a^2}$

(D)  $\frac{s}{s^2-a^2}$

(GATE 2022 ES)

Figure 1: Plot of  $h(n)$ , taken from python3

**Solution:**

$$\mathcal{L}(f(x)) = \int_{-\infty}^{\infty} e^{-sx} f(x) dx \quad (8.52)$$

$$\text{We can write } \sin(ax) = \frac{e^{ax} - e^{-ax}}{2i} \quad (8.53)$$

From (8.53)

$$\mathcal{L}(\sin(ax)) = \int_0^\infty e^{-sx} \left( \frac{e^{iax} - e^{-iax}}{2i} \right) dx \quad (8.54)$$

$$= \frac{1}{2i} \int_0^\infty e^{-x(s-ia)} - e^{-x(s+ia)} dx \quad (8.55)$$

$$= \frac{1}{2i} \left( \frac{e^{-x(s-ia)}}{-(s-ia)} + \frac{e^{-x(s+ia)}}{-(s+ia)} \right) \Big|_0^\infty \quad (8.56)$$

$$= \frac{1}{2i} \left( \frac{1}{s-ia} - \frac{1}{s+ia} \right) \quad (8.57)$$

$$= \frac{a}{s^2 + a^2} \quad (8.58)$$

So, option (A) is correct.

8.8 The input  $x(t)$  to a system is related to its output  $y(t)$  as

$$\frac{dy(t)}{dt} + y(t) = 3x(t-3)u(t-3)$$

Here  $u(t)$  represents a unit-step function.

The transfer function of this system is

(A)  $\frac{e^{-3s}}{s+3}$

(B)  $\frac{3e^{-3s}}{s+1}$

(C)  $\frac{3e^{-(s/3)}}{s+1}$

(D)  $\frac{e^{-(s/3)}}{s+3}$

(GATE IN 2022)

**Solution:**

$$\frac{dy(t)}{dt} + y(t) = 3x(t-3)u(t-3) \quad (8.59)$$

By applying Laplace Transform on both sides

$$x(t) \xleftrightarrow{\mathcal{L}} X(s) \quad (8.60)$$

$$x(t - t_o) \xleftrightarrow{\mathcal{L}} X(s)e^{-st_o} \quad (8.61)$$

$$sY(s) + Y(s) = 3X(s)e^{-3s} \quad (8.62)$$

$$Y(s)(s + 1) = 3X(s)e^{-3s} \quad (8.63)$$

$$H(s) = \frac{Y(s)}{X(s)} = \frac{3e^{-3s}}{s + 1} \quad (Re(s) > 0) \quad (8.64)$$

$$H(j\omega) = \frac{3e^{-3j\omega}}{1 + j\omega} \quad (8.65)$$

$$= \frac{3(\cos 3\omega - j\sin 3\omega)}{1 + j\omega} \quad (8.66)$$

$$|H(j\omega)| = \frac{3}{\sqrt{1 + \omega^2}} \quad (8.67)$$

$$phase = \tan^{-1} \left( \frac{\omega \cos(3\omega) + \sin(3\omega)}{\omega \sin(3\omega) - \cos(3\omega)} \right) \quad (8.68)$$

Figure 8.9: Plot for magnitude of transfer function

8.9 Consider the circuit shown in the figure with input  $V(t)$  in volts. The sinusoidal steady state current  $I(t)$  flowing through the circuit is shown graphically (where  $t$  is in seconds). The circuit element  $Z$  can be\_\_\_\_\_.

GATE 2022 EC

39

- (a) a capacitor of 1 F
- (b) an inductor of 1 H
- (c) a capacitor of  $\sqrt{3}$  H
- (d) an inductor of  $\sqrt{3}$  H

Figure 8.10: Plot for phase of transfer function

**Solution:**

The current through the circuit can be expressed as

$$I(t) = \sin\left(t - \frac{\pi}{4}\right) \quad (8.69)$$

Since, the voltage seems to be leading the current the circuit element  $z$  is an inductor with inductance  $L$ .

Applying KVL in the circuit,

$$R.I(t) + L \frac{dI(t)}{dt} = \sin(t) \quad (8.70)$$

Symbol	Value	Description
$V(t)$	$\sin t$	Time varying voltage source
$I(t)$	$\sin t - \frac{\pi}{4}$	Current flowing in the circuit
$R$	$1\Omega$	Resistor in series to Z
$Z$	$Z$	Circuit element

Table 8.7: Variable description

Applying Fourier transform to the differential equation,

$$R.I(s) + sL.I(s) - \frac{1}{s^2 + 1} = 0 \quad (8.71)$$

$$I(s)(R + sL) = \frac{1}{s^2 + 1} \quad (8.72)$$

$$\sin(at + b) \xleftrightarrow{\mathcal{L}} \frac{a \cos(b) + s \sin(b)}{a^2 + s^2} \quad (8.73)$$

$$\sin\left(t - \frac{\pi}{4}\right) \xleftrightarrow{\mathcal{L}} \frac{1 - s}{2(s^2 + 1)} \quad (8.74)$$

$$\frac{1 - s}{2(s^2 + 1)}(R + sL) = \frac{1}{s^2 + 1} \quad (8.75)$$

Upon plugging in  $R=1\Omega$ ,

$$L = \frac{1}{s} \quad (8.76)$$

Applying inverse Laplace,

$$L = 1H \tag{8.77}$$

## Chapter 9

# Fourier transform

9.1 The Fourier transform  $X(j\omega)$  of the signal

$$x(t) = \frac{t}{(1+t^2)^2} \text{ is } \text{—————}.$$

GATE-2022-EC-15

(A)  $\frac{\pi}{2j}\omega e^{-|\omega|}$

(B)  $\frac{\pi}{2}\omega e^{-|\omega|}$

(C)  $\frac{\pi}{2j}e^{-|\omega|}$

(D)  $\frac{\pi}{2}e^{-|\omega|}$

**Solution:**

Symbol	Value	Description
$x(t)$	$\frac{t}{(1+t^2)^2}$	Signal
$X(\omega)$	$\int_{t=-\infty}^{\infty} x(t) e^{-j\omega t} dt$	Fourier transform of $x(t)$

Table 9.1: Variable description

The Fourier transform of the form  $x(t)=e^{-a|t|}$  is

$$x(t) \xleftrightarrow{\text{F.T.}} X(\omega) \quad (9.1)$$

$$X(\omega) = \frac{2a}{a^2 + \omega^2} \quad (9.2)$$

Consider,

$$x(t) = e^{-|t|} \quad (9.3)$$

$$X(\omega) = \frac{2}{1 + \omega^2} \quad (9.4)$$

By using differentiation property from (A.1.5),

$$tx(t) \xleftrightarrow{\text{F.T.}} j \frac{d}{d\omega} X(\omega) \quad (9.5)$$

$$tx(t) \xleftrightarrow{\text{F.T.}} j \left[ \frac{d}{d\omega} \left( \frac{2}{1 + \omega^2} \right) \right] \quad (9.6)$$

$$te^{-|t|} \xleftrightarrow{\text{F.T.}} \frac{-4j\omega}{(1 + \omega^2)^2} \quad (9.7)$$

Applying duality property from (A.2.3),

$$\frac{-4jt}{(1 + t^2)^2} \xleftrightarrow{\text{F.T.}} 2\pi(-\omega) e^{-|\omega|} \quad (9.8)$$

$$\frac{t}{(1 + t^2)^2} \xleftrightarrow{\text{F.T.}} \frac{-2\pi\omega e^{-|\omega|}}{-4j} \quad (9.9)$$

$$\frac{t}{(1 + t^2)^2} \xleftrightarrow{\text{F.T.}} \frac{\pi}{2j} \omega e^{-|\omega|} \quad (9.10)$$

9.2 For a vector  $\bar{x} = [x[0], x[1], \dots, x[7]]$ , the 8-point discrete Fourier transform (DFT) is denoted by  $\bar{X} = \text{DFT}(\bar{x}) = [X[0], X[1], \dots, X[7]]$ , where

$$X[k] = \sum_{n=0}^7 x[n] \exp \left( -j \frac{2\pi}{8} nk \right).$$

Here  $j = \sqrt{-1}$ . If  $\bar{x} = [1, 0, 0, 0, 2, 0, 0, 0]$  and  $\bar{y} = \text{DFT}(\text{DFT}(\bar{x}))$ , then the value of  $y[0]$  is.

GATE-2022-EC-55

**Solution:**

Parameter	Description	Value
$\bar{X}$	$\text{DFT}(\bar{x})$	—
$\bar{x}$	vector	$[1, 0, 0, 0, 2, 0, 0, 0]$
$\bar{y}$	$\text{DFT}(\text{DFT}(\bar{x}))$	—

Table 9.2: Given Parameters

DFT of  $\bar{x}$

$$X[k] = \sum_{n=0}^7 x[n] \exp \left( -j \frac{2\pi}{8} nk \right) \quad (9.11)$$

As the only non-zero values in  $x$  are  $x[0]$  and  $x[4]$ :

$$X[k] = x[0] + x[4] \exp(-j\pi k) \quad (9.12)$$

After substituting the values of  $k$  ranging from 0 to 7,

$$\bar{X} = \text{DFT}(\bar{x}) = [X[0], X[1], \dots, X[7]] \quad (9.13)$$

$$\bar{X} = [3, -1, 3, -1, 3, -1, 3, -1] \quad (9.14)$$

$$\bar{y} = \text{DFT}(\text{DFT}(\bar{x})) \quad (9.15)$$

$$\bar{y} = [3, -1, 3, -1, 3, -1, 3, -1] \quad (9.16)$$

$$y[0] = \sum_{n=0}^7 x[n] \quad (9.17)$$

$$= x[0] + x[1] + \cdots + x[7] \quad (9.18)$$

$$= 3 - 1 + 3 - 1 + 3 - 1 + 3 - 1 = 8 \quad (9.19)$$

9.3 **Question:** An LTI system is shown in the figure where

$$H(s) = \frac{100}{s^2 + 0.1s + 10}$$

The steady state output of the system for an input  $x(t)$  is given by  $y(t) = a + b \sin(10t + \theta)$ . The values of ' $a$ ' and ' $b$ ' are

**Solution:**

Symbol	Value	Description
$x(t)$	$1 + 0.1 \sin(10t)$	Input Signal
$y(t)$	?	Output of the system
$H(s)$	$\frac{100}{s^2 + 0.1s + 10}$	Impulse Response

Table 9.3: Given Information

(a) **Theory:** If a sinusoidal input is given to a system, whose transfer function is known, the output can be calculated as follows

$$y(t) = h(t) * x(t) \quad (9.20)$$

$$Y(s) = H(s)X(s) \quad (9.21)$$

Let  $s = j\omega$

$$Y(j\omega) = H(j\omega)X(j\omega) \quad (9.22)$$

If  $\Phi$  is the phase of  $H(j\omega)$ ,

$$H(j\omega) = |H(j\omega)| e^{j\Phi(\omega)} \quad (9.23)$$

If  $x(t) = \cos(\omega_0 t)$ ,

$$X(j\omega) = \pi (\delta(\omega - \omega_0) + \delta(\omega + \omega_0)) \quad (9.24)$$

Now,

$$Y(j\omega) = (\delta(\omega - \omega_0) + \delta(\omega + \omega_0)) |H(j\omega)| e^{j\Phi(\omega)} \quad (9.25)$$

$$(9.26)$$

Since  $|H(j\omega)| \delta(\omega - \omega_0)$  is zero everywhere except at  $\omega_0$

$$Y(j\omega) = |H(j\omega_0)| e^{j\Phi(\omega_0)} \delta(\omega - \omega_0) \quad (9.27)$$

$$+ |H(-j\omega_0)| e^{j\Phi(-j\omega_0)} \delta(\omega + \omega_0) \quad (9.28)$$

As  $h(t)$  is real,

$$H(\omega) = H^*(-\omega)$$

$$\Phi(-\omega_0) = -\Phi(\omega_0)$$

Hence

$$Y(\omega) = |H(\omega_0)| \left( e^{j\Phi(\omega_0)} \delta(\omega - \omega_0) + e^{-j\Phi(\omega_0)} \delta(\omega + \omega_0) \right) \quad (9.29)$$

Taking Inverse Fourier Transform,

$$\delta(\omega - \omega_0) \xleftrightarrow{\mathcal{F}} \frac{1}{2} e^{j\omega_0 t} \quad (9.30)$$

$$\implies y(t) = |H(\omega_0)| \frac{1}{2} \left( e^{j(\omega_0 t + \Phi(\omega_0))} + e^{-j(\omega_0 t + \Phi(\omega_0))} \right) \quad (9.31)$$

$$\implies y(t) = |H(\omega_0)| \cos(\omega_0 t + \Phi(\omega_0)) \quad (9.32)$$

(b) The given input can be assumed to be a superposition of  $u(t)$  and  $0.1 \sin(\omega_0 t)u(t)$ .

$$\omega_0 = 0 \text{ and } \omega_0 = 10$$

for the constant input and the sinusoidal input respectively.

$$y(t) = |H(0)| + |H(10)| \sin(10t + \Phi(10)) \quad (9.33)$$

Here

$$H(\omega) = \frac{100}{(j\omega)^2 + 0.1(j\omega) + 10} \quad (9.34)$$

$$\implies H(\omega) = \frac{100}{10 - \omega^2 + j(0.1\omega)} \quad (9.35)$$

$$\implies |H(\omega)| = \frac{100}{\sqrt{(10 - \omega^2)^2 + (0.1\omega)^2}} \quad (9.36)$$

$$\therefore |H(0)| = 10 \text{ and } |H(10)| \approx 1 \quad (9.37)$$

The phase  $\Phi(\omega)$  is given by

$$\Phi(\omega) = \tan^{-1} \frac{0.1\omega}{\omega^2 - 10} \quad (9.38)$$

$$\implies \Phi(10) = \tan^{-1} \frac{1}{90} \quad (9.39)$$

Hence the output of the system

$$y(t) = 10 + \sin\left(10t + \tan^{-1} \frac{1}{90}\right) \quad (9.40)$$

Hence  $a = 10$  and  $b = 1$

Figure 9.1: Input of the system,  $x(t)$

Figure 9.2: Output of the system,  $y(t)$

Figure 9.3: Transfer function of the system,  $H(s)$

## Appendix A

# Fourier transform

A.1 The Differentiation in frequency domain is as follows

Let  $x(t)$  be a signal such that,

$$x(t) \xleftrightarrow{\text{F.T.}} X(\omega) \quad (\text{A.1.1})$$

$$X(\omega) = \int_{t=-\infty}^{\infty} x(t) e^{-j\omega t} dt \quad (\text{A.1.2})$$

$$\frac{d}{d\omega} X(\omega) = \int_{t=-\infty}^{\infty} x(t) (-jt) e^{-j\omega t} dt \quad (\text{A.1.3})$$

$$j \frac{d}{d\omega} X(\omega) = \int_{t=-\infty}^{\infty} tx(t) e^{-j\omega t} dt \quad (\text{A.1.4})$$

$$tx(t) \xleftrightarrow{\text{F.T.}} j \frac{d}{d\omega} X(\omega) \quad (\text{A.1.5})$$

A.2 The duality property is as follows

From inverse Fourier transform we get,

$$x(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} X(\omega) e^{j\omega t} d\omega \quad (\text{A.2.1})$$

Replacing  $t$  by  $-t$  and multiplying  $2\pi$  on both sides we get,

$$2\pi x(-t) = \int_{-\infty}^{\infty} X(\omega) e^{-j\omega t} d\omega \quad (\text{A.2.2})$$

$$X(t) \xleftrightarrow{\text{F.T.}} 2\pi x(-\omega) \quad (\text{A.2.3})$$
